Abstract of the Disclosure

The invention provides a method for tracking business to business communication among trading partners in a supply chain. Trading partners utilize a central hub to coordinate and track events. Prior to sending an event to other trading partners, a trading partner obtains an event tracking number from a central hub. Trading partners receiving the event can validate its unique status and validity by observing content within the event itself and by querying the central hub for additional information. Using the invention, the disparate communication systems used by trading partners and the lack of a system for clearly identifying and tracking events, no longer exists and the possibility of confusion as to the uniqueness of any one event when compared with another with similar characteristics is eliminated.
